

# Compensation for the use of suitable forest land for solar power generation

Establishment and maintenance of perennial vegetation is paramount for ensuring the health and function of both the land and the solar farm. Sites are typically cleared of all vegetation and subjected ...

In this work, the potential solar land requirements and related land use change emissions are computed for the EU, India, Japan and South Korea. A novel method is developed within an...

While there are potentially other ways (such as agrivoltaics) to limit the land-use impacts of utility-scale PV, the primary, if not the only, way to mitigate the inevitability of rising land costs is to minimize the ...

This report provides a rapid assessment of potential conversions of forests to solar facilities.

After discussing solar land-use metrics and our data-collection and analysis methods, we present total and direct land-use results for various solar technologies and system configurations, on both a ...

Project partners have prepared a number of research summaries and policy analyses, and assembled additional resources that together assess each New England State's potential to meet their climate ...

Deployment of solar power installations is a key element of this expansion of renewable energy. Conservationists may rightfully feel morally com-pelled to do what they reasonably can to support the ...

Net-metering and other energy compensation programs that offer a special rate for energy from renewable sources can be used to incentivize smart land use, including smaller-scale arrays, those ...

This study conducts a cost-benefit analysis of replacing forest land with a large-scale solar (LSS) photovoltaic (PV) facility, using data from a proposed 9.35 MW DC project in the ...
