

This Instructable will give you a step by step process on how to carve a real wind turbine blade out of wood (not those fake ones from a "PVC pipe, but they are cool too.).

This instructable provides a step-by-step process on how to carve a real wind turbine blade out of wood. The process requires basic tools such as a drawknife, saw, hammer and chisel, ...

Building wooden turbine blades with cutting tools can be an enjoyable and rewarding project. With the right techniques and high-quality tools, you can create durable blades that are both ...

We have a steel generator rotor that is being scrapped and would like to remove a section from it for analysis (cracked, away from the retaining rings). Does anyone have any suggestions for ...

One particularly vital aspect of this process is the cutting phase. The cutting process is the basis of generator set production, because it is to ensure that each component conforms to the precise ...

Whether you need a generator for a mobile business, an industrial application, or a specialty vehicle, our team works closely with you to ensure that every component is optimized for its intended use.

Start by marking out the pieces of wood. Measurements are made at the "stations" of which there are five along the length of each blade, equally spaced at intervals of 230mm. o Mark the position of each ...

In this video, you'll see how workers cut through thick steel and copper windings, revealing the solid core of the generator.

You can either make a template and trace it onto all three blades, or just lay it out on one blade and cut out the profile, then trace it to the other three. Cut out the blades with a band saw, circular saw or ...

Here are pictures of the jigs and the bench setup to carve the windward side of the blades. I used a jigsaw to cut them, but you can also use a bandsaw. The two jigs on the left are for the windward ...
