

Taller turbines demand higher wind measurements. With its top sensor level at 80 meters, this 81.3 meter tower will give you reliable data at or near the hub height of today's most commonly-used ...

Measurements on site are important to ensure the wind farm development has the expected wind climate. We have a long track record of installation, operation, maintenance and monitoring of wind ...

Learn about MET tower facts at Clinton Wind by NextEra Energy Resources. Discover how we measure wind data for optimal energy production.

Wind measuring towers (sometimes called meteorological evaluation towers (MET)) are used to verify the wind characteristics at a potential site for a wind farm. For the safety of low flying aircraft, these ...

Our braced and self-supporting towers up to 150 metres high meet the highest standards and are designed for the installation of wind, rainfall or solar radiation measurement systems. These towers ...

To do so, they need a system tower to measure wind speed, wind direction, temperature, and pressure at multiple heights. These elements ensure that assessment data is continuous and consistent to ...

Whether you are a wind developer, turbine manufacturer or any other party with a need to characterize the wind, we have a team of professionals ready to assist in making your project a ...

The wind measuring devices for this purpose are installed on the ground, on wind turbine nacelles, and offshore on buoys and vessels. The important thing is that the technology is selected and employed ...

This paper evaluates a data-driven classification approach of operational wind turbine blades based on consecutive tower-radar measurements that are each compressed in a two-dimensional slow-time to ...

The locations of all turbines were visually verified to within 10 meters using high-resolution imagery. Technical specifications of the turbines are based on the make and model and ...
