

What type of electricity does a solar panel use?

AC is the type of electrical current used when you plug appliances into normal wall sockets. What's the difference between solar PV panels and solar thermal panels? Solar PV panels generate electricity, as described above, while solar thermal panels generate heat.

How do solar panels generate electricity?

This process is constant. Over 500 million tons of hydrogen atoms are converted into helium every second, resulting in photons that generate solar energy here on Earth. In a nutshell, solar panels generate electricity when photons (those particles of sunlight we discussed before) hit solar cells. The process is called the photovoltaic effect.

How do solar panels work?

Think of solar panels as reverse LEDs. While an LED converts electrical energy into light by allowing electrons to flow from high to low energy states, solar panels do the opposite—they absorb light photons and use that energy to excite electrons from low to high energy states, creating electrical current.

What is the photovoltaic effect?

The photovoltaic effect is the fundamental process that makes solar panels possible. Discovered in 1839 by French physicist Edmond Becquerel when he was just 19 years old, this phenomenon occurs when certain materials generate electrical current upon exposure to light. Think of solar panels as reverse LEDs.
