

Is there no solar power generation in Northern Europe

Now, much of the region's power comes from solar arrays and wind farms, whose output varies with the whims of the weather.

Solar thermal technologies can be deployed in most European regions and are a particularly good option in Europe's eastern and south-eastern countries, where solar thermal heat is often the cheapest option to ...

Recently, a project to build a solar farm that would supply 15% of Europe's power failed because the cost of power transmission did not drop as quickly as the price of solar panels.

Southern Europe enjoyed a final surge of sunlight before the onset of winter, with Italy achieving a 22% increase in solar power generation compared to the November average while Northern...

In parts of Europe, there are signs that increasingly cheap batteries are beginning to displace natural gas in the early evening, when power demand is high, but solar output is waning.

The question for solar in Northern Europe is no longer whether it works; it's how quickly and responsibly we can scale it. The journey may be complex and technical, but its momentum is here...

As solar PV deployment ramps up across the EU, it's not just about harnessing clean energy - it's also about powering job growth. The expansion of solar installations creates a ripple effect, spurring demand for skilled ...

Existing electrical grids in many European countries are often outdated and not designed to handle the influx of decentralized energy sources like solar. This hampers the efficient distribution of solar ...

Solar broke another historical record in power generation this March for the third consecutive month, making up more than 10% of Europe's electricity mix - shows Eurelectric data.

Despite Europe's climate commitments, several countries, including Italy, Germany and the UK, continue to rely heavily on gas power for electricity generation.
