

The review provided intensive look at (1) dust characteristics, accumulation, and impact on PV, (2) PV cleaning: review and classification, (3) PV cleaning methodology.

This study introduces an automated defect detection pipeline that leverages deep learning and computer vision to identify five standard anomaly classes: Non-Defective, Dust, ...

Using a deep learning architecture, the images were classified into two categories: PV panels with dust and PV panels without dust. The results were presented in the form of a confusion matrix.

Dust accumulation is described using a Non-homogeneous compound Poisson process (NHCPP), while temperature evolution is modeled using Markov chains. Within this framework, we consider the ...

In this research, we propose an integrated approach that combines image processing techniques and deep learning-based classification for the identification and classification of dust on ...

Dust deposition on PV modules is a critical issue, particularly in arid and semi-arid regions, as it reduces light transmission and causes significant power losses.

The study outlines the negative consequences of each element on dust buildup on the functionality and efficiency of photovoltaic systems, as well as strategies for eliminating dust and ...

In this paper, we proposed an image processing technique to identify the dust particle on photovoltaic panel and a deep learning technique to classify the PV panel having dust and not ...

In this paper, we proposed an image processing technique to identify the dust particle on photovoltaic panel and a deep learning technique to classify the PV panel having dust and not having dust.

In this study, an efficient PV fault detection method is proposed to classify different types of PV module anomalies using thermographic images. The proposed method is designed as a multi ...
