

Our portfolio includes not only automatic solar panel production lines, but also individual equipment for PV modules production, from glass loading equipment at the beginning to solar panel assembly and ...

UV curing is used to solidify the encapsulant layers in solar panels. These layers, typically made from materials like EVA (ethylene-vinyl acetate), help protect the delicate photovoltaic cells from moisture, ...

Traditional UV curing systems, while effective, often rely on grid power with significant carbon footprints. Enter photovoltaic panel light curing - a game-changing fusion of solar energy and precision ...

"My group is looking at using millisecond light pulses to convert materials instead of using conventional heating processes to do the annealing." The research was conducted in collaboration with ...

Photonic curing is a thin-film processing technique that can enable high-throughput perovskite solar cell (PSC) manufacturing. However, photonic curing has many variables that can ...

Whether you're brand new to UV curing or familiar with the basics, let us help guide you on what you need to know and the products you can use for your next project!

The SunSpot 2 is a next-generation, high-intensity, ultra-compact light curing system, and the industry's price/performance leader. We designed it with a low cost of ownership in mind, as demonstrated ...

In the production process, it is necessary to bond the back panel to the battery cells and make them tightly bonded through curing. The traditional curing method requires the use of lamps, while UVLED ...

In the dynamic landscape of renewable energy, the application of UV curing systems in photovoltaic manufacturing stands as a testament to innovation and efficiency.

Vitralit® UH 1411, developed by Panacol, is a new flexible, hybrid epoxy resin-acrylate adhesive that cures with UV light, specifically designed for foil lamination of organic (OPV) and ...
