

Several exhaust systems in the generator room

Do you need a muffler for a generator?

A suitable muffler must be included in the exhaust line. Elements of the exhaust system, which are located inside the generator room, must be insulated to reduce heat radiation. The open end of the pipe must be equipped with a visor to protect against rain or snow entering the exhaust system (or cut at an angle of 60° to the horizontal).

How does a generator exhaust system work?

While it may seem like a simple pipe run, the system plays a crucial role in ensuring facility safety, maintaining air quality, and optimizing generator performance. At the core of the system is the generator exhaust pipe, which connects directly to the engine's manifold. From there, exhaust gases are routed through a combination of:

Do you need a through-the-wall exhaust kit for a generator?

In many commercial or industrial settings, a through-the-wall exhaust kit for a generator offers a convenient and space-saving way to route exhaust gases outdoors. But while these systems are practical in certain installations, they come with critical design and compliance considerations. A through-wall setup is often used when:

Where does a backup generator exhaust go?

In comparison, simple backup generator systems located outside a building are often exhausted directly out the top of the units. Units located inside a building often require the exhaust to be routed up through the roof, up the side of the building, or to a free-standing stack.
