

What is a single phase inverter?

Single-phase grid connection inverters, ideal for installation in solar systems with single-phase voltage, commonly used homes, country houses that need quality monophasic inverters at the best market price. Single-phase pure sine wave inverters, single-phase inverters for solar self-consumption installations.

What is the difference between a 1 phase and 3 phase inverter?

1-phase systems only supply the grid via a single phase, which can lead to imbalances during higher load peaks and greater consumption. In contrast, 3-phase inverters distribute the current more evenly across three phases, which improves grid stability and reduces the load on the individual lines.

Who should use a single-phase inverter?

Single-phase inverters are ideal for smaller solar systems, especially in private households. They are ideal for:
Private households: Single-family homes and small apartments with moderate power consumption. Small commercial enterprises: Offices, stores or workshops with manageable energy requirements.

Why should you use a 3-phase inverter?

Large office buildings, factories or other commercial facilities benefit from 3-phase power distribution, which ensures a more even load on the electrical infrastructure. The use of single-phase inverters in such environments can lead to overloads, power losses or inefficient operation.
