

Drones have been fitted with solar cells 20 times thinner than a human hair and proven to be able to sustain long-term flight with electricity generation.

The new ultralight and flexible solar cell module is only 20 times thinner than a strand of human hair and can power a wide range of electronics in areas with light.

The paper proposes the design of a power supply circuit for charging drone batteries using thin-film solar cells. Thin-film solar cells are arranged in parallel to produce a fixed voltage and a ...

By integrating 24 solar cells into the frame of a compact commercial quadcopter drone, researchers demonstrated the practical application of this solar technology. One of the standout ...

A simple, efficient simulator has been developed to predict the generation of photovoltaic energy and its storage in Li-ion batteries, for an autonomous drone with four wings covered by solar ...

Researchers at the University of Linz, Austria, have developed solar cells that, at less than 2.5 micrometers, are 40 times thinner than a sheet of paper. They use the promising perovskite...

According to the team, the flexible and ultralight solar cell module, 20 times thinner than a human hair strand, can power various electronics anywhere there is light.

The new ultralight and flexible solar cell module is ...

Ultra-thin, ultra-light solar energy cells are using new technology to generate enough power for long-duration drone flights without any requirement for wired recharging.

Researchers at the Johannes Kepler University Linz (JKU) in Austria have created ultra-thin and lightweight solar cells to give energy autonomy to drones.
