Thin-film solar cells are a type of solar cell made by depositing one or more thin layers (thin films or TFs) of photovoltaic material onto a substrate, such as glass, plastic or metal.

Thin film technology has played a transformative role in the evolution of solar energy, offering lightweight, cost-effective, and flexible solutions for capturing solar power.

Thin-film solar cells (TFSC) are manufactured using a single or multiple layers of PV elements over a surface comprised of a variety of glass, plastic, or metal.
