What is a load in a PV system?

Equipment that uses electricity to operate is called a load. Loads are the largest single influence on the size of a PV system. It is better to supply some loads with power from other generating means to limit the size of a PV system. For example, powering an electric range in a home with a PV system can be cost-prohibitive.

Why is determining electrical loads important for stand-alone photovoltaic systems?

Understanding and accurately determining electrical loads for stand-alone photovoltaic systems is crucial for several reasons. First, it ensures the system is appropriately sized to meet the power requirements of various devices, optimizing its performance and efficiency.

What is a phantom load in a PV system?

A standalone PV system designer needs to consider the duty cycles of electrical equipment so that when an appliance is ready to turn on, the PV system will have enough power available. A phantom load is a load type that draws a small amount of current, even when the load is OFF.

What is the peak load of a solar panel system?

Example: If all appliances in a house are simultaneously turned on and consume a total of 6kW, then the peak load is 6kW. Seasonal load calculation accounts for varying power demands throughout different seasons of the year. Solar output can vary depending on the season, so this is crucial for your solar panel system design.
